

# Reliably integrate accurate completions data with WellView® while you frac

Well Data Labs teamed up with Peloton to build a native add-in to streamline the process of reliably importing completions data into the WellView® 10 stimulation table without ever leaving the WellView® user interface.

#### On-site Data Capture

Data is generated in frac van by service company.

#### Well Data Labs API

Automatically creates a secure, authenticated connection.

#### Integrate Data with WellView®

Without any manual data entry or import/export process.

We believe that your data belongs to you – so we created the Well Data Labs Frac Job Importer for WellView® to ensure that your completions data is parsed correctly and is accurately moved from one application to the next without gaping holes. Powered by the Well Data Labs completion platform, ongoing stage summary information is created by gauges and meters in the field and then layered with on-site engineering intelligence to create a dataset you can trust. The Well Data Labs RESTful API creates a secure connection between Well Data Labs and WellView® and allows users to update their well file without any manual data entry or import/export process.

Not using Well Data Labs to manage your completions data yet?
